comprising a polypeptide described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an enthods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or presisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide (12) a method of soreening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide. Novx (14) a method for producing the above polypeptide. Novx (14) a method for producing the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The amunomodulator, cyclostatic, noorcopic, neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The colympeptide is useful in manufacturing a medicament for treating a medicament and moderness and van be used to diagnose, treat or prevent metabolic activities, and can also be used as hybridisation associated with a human disease. The polypeptide or the nucleic acide sease or immune disorders such as allabetes or obesity, infections, canceri, immune disorders haematopoietic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   JIWM/)
PARKER REPRESENTATION OF THE PROPERTIES OF THE PROPERTY OF THE
```

```
The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the abbrrant expression and activity of NOVX by supplementing the patient our polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polynucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which pathents may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NOVX polypeptide antibodies, agonists and antagonists may also be used as anti-NOVX polypeptide antibodies, agonists and antagonists may also be used to modulate NOVX polypeptide expression and activity of NOVX polypeptides. The anti-NOVX polypeptide expression and activity of NOVX polypeptides and polynucleotide expression and activity of NOVX polypeptides and polynucleotide may be used in this way to prevent, diagnoses and treat: metabolic disorders, diabetes, obesity, infectious disorders, all also acceptable of the various dyslipidaemism, metabolic disorders, and antagonisms, and antipolic disorders, and antipolic d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                   Claim 1; SEQ ID NO 98; 395pp; English.

ö

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule described above; (3) an isolated nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the molecule described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a disease associated with altered levels of expression of the above colypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of secreting a pathology associated with the polypeptide; (12) a method of cor preventing a pathology associated with the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide.

Cor preventing a pathology associated with the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide.

Cor preventing a pathology associated with the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide.

Cor preventing a pathology associated with the above polypeptide. NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a columnary has need to an ease and the polypeptide of the polype acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer,

                                                                                                                                                                                                                          human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer, cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder;
       disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the present invention.
neurodegenerative disorders such as Alzheimer's disease or Parkinson's
                                                                                     Gaps

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX by supplementing the patient our polynucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our correctify mutations. Conversely, antisense NA molecules production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polypurcleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators anti-NOVX polypeptide sand antagonists and antigonists may also be used to modulate NOVX polymucleotide expression and activity of NOVX colappeptides. The anti-NOVX polypeptide expression and activity of NOVX colappeptides. The anti-NOVX polypeptide expression and activity of NOVX colappeptides and polymucleotide expression and activity of NOVX colappeptides and polymucleotide expression and activity of NOVX colappeptides and polymucleotide expression and activity of NOVX colappeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, and the various dyslipidaemias, metabolic chaematopoietic disorders, and the various dyslipidaemias, metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E, Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG, Shimkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; SEQ ID NO 96; 395pp; English

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVY protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) a cell comprising the nucleic acid molecule described above; (7) methods for determining the binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or a permotory of intentifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or a pathology associated with the polypeptide; (12) a method of carrivity of the polypeptide; (12) a method of carrivity of the polypeptide; (12) a method for modulating or preventing a pathology associated with the above polypeptide in a memmal; and (14) a method for producing the above polypeptide in a memmal; and (14) a method for producing the above polypeptide; NOVX immandal and (14) a method for producing the above polypeptide in a memmal; and contacterial, virucide,

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and activity of NOVX polypeptides and activity of NOVX polypeptides and conversely, antisense NA molecules expression or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX binding with the cells own genes and preventing their expression. NOVX copymentered and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of significant of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX.

Copymeptides. The anti-NOVX polypeptide antibodies may also be used as diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymerial and polypeptides and polymerial and polypeptides and polymerial and polymerial and polypeptides and polymerial and polypeptides and polymerial and polymerial and polymerial and polymerial and disorders, immune disorders, disorders, disorders, and the various dyslipidaemias, metabolic disorders associated with obesity, the metabolic syndrome X and antibodies associated with obesity, the metabolic expenses an oresis.
                                                                                                                                                                                                                                                                                                                                     Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.
                                                                                                                                 Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E; Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shinkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen A, Gangolli EA, Rieger DK, Spaderna SK;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.

                                                                                                                                                                                                                                                        The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protein or its fragments of 9-20 an individual against TADG-15, having, suspected of having or at risk of getting cancer. Purtherance, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                              Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunomodulator; cytostatic; nootropic; neuroprotective;

WPI; 2004-213931/20. N-PSDB; ADN62905. Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease

Claim 1; SEQ ID NO 102; 395pp; English.

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX by supplementing the patient our polymentides may be used to treat disorders associated with decreased complements of the patient our controlled may be administered to down regulate expression of NOVX polypeptides by production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by colinding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators candiantage and antagonists of the expression and antagonists may also be used to modulate NOVX polypeptide expression and antagonists may also be used to modulate NOVX polypeptide expression and antagonists may also be used to modulate NOVX polypeptide expression and antagonists may also be used to modulate NOVX polypeptide antibodies, agonists and antagonists may also be cused to modulate NOVX polypeptide expression and antagonists may also be diagnostic agents for detecting the presence of NOVX in samples. NOVX polypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious

```
ö
  anorexía, cancer, cancer-associated cachexía, neurodegenerative
                          disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, haematopoietic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunomodulator; cytostatic; nootropic; neuroprotective;

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the mucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying a potential therapeutic agent for above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of secritity or of latency or predisposition to consprintly of the polypeptide described above; (13) methods of treating the activity or of latency or predisposition to consprending a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide, consprending a medicament for treating and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a colypeptide is and any present metable. The polypeptide is the polypeptide or produced and antilipaemic and any and or and any produced the polypeptide or produced and any produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to isolated NOVX polypeptides and polymucleotides.

NOVX polypeptides and polymucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX by supplementing the patient our polymucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our polymucleotides may be used to treat disorders associated with decreased complements of NOVX polypeptides by conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by conversely antisense may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of crestorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators the production of antibodies and in assays to identify modulators anti-NOVX polypeptides and antagonists and antagonists and antagonists of antibodies and in the expression and activity of NOVX. The anti-NOVX polypeptides may be used in this way to prevent, colypeptides and polymucleotide expression and activity of NOVX polypeptides may be used in this way to prevent, colypeptides and polymucleotides may be used in this way to prevent, colypeptides and polymucleotides may be used in this way to prevent, colypeptides and polymucleotides may be used in this way to prevent, colypeptides and polymucleotides may be used in this way to prevent, colypeptides and polymucleotides may be used in this way to prevent, colypeptides polypeptides. Parkinson's Disorder, immune disorders, alternating disorders, alternations dyslibutions dy

```
comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above colypeptide or nucleic acid molecule in a first mammalian subject; (9) a complete of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for case in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a corporate part of the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a community of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide or producing the above polypeptide or producing the above polypeptide or producing a medicament for treating a confidence associated with a human disease. The polypeptide or the nucleic caid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders und an also be used as hybridisation condisease in chromosome mapping, tissue typing, preventive medicine and probable, in chromosome mapping, tissue typing, preventive medicine and produced to mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human; NOVX; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer-associated cachexia; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia; metabolic syndrome X;

Dipippo VA; New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or Smithson G, Millet I, Peyman JA, Kekuda R, Ju J, Li L, Guo X, Patturajan M, Spytek KA, Edinger SR, Ellerman K, Malyankar UM; Ort T, Gorman L, Zerhusen BD, Anderson DW, Zhong M, Catterton E, Ji W, Miller CE, Rastelli L, Stone DJ, Pena CEA, Shenoy SG; Shinkets RA, Rothenberg ME, Leach MD, Agee ML, Berghs C, Dipippo Eisen AJ, Gangolli EA, Rieger DK, Spaderna SK; Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell

Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease

Claim 1; SEQ ID NO 94; 395pp; English.

The invention relates to isolated NOVX polypeptides and polynucleotides. NOVX polypeptides and polynucleotides are used to prevent, diagnose or

activity of NOVX polypeptides. For example, NOVX polypeptides and polymucleotides may be used to treat disorders associated with decreased expression or activity of NOVX by supplementing the patient our production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymucleotides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of restorative therapy. NOVX polypeptides may also be used as antigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NOVX. The anti-NOVX polypeptide expression and activity of NOVX polypeptides and integers and antagonists may also be used as dispositic agents for detecting the presence of NOVX polypeptides and polymucleotides may be used as diagnoser and treat: metabolic disorders, diabetes, obesity, infectious ö rreat a medical condition in human related to the aberrant expression and disease, anorexia, cancer, cancer-associated cachexia, neurodegenerative disorders. Alzhabimer's Disease, Parkinson's Disorder, immune disorders, hamenatopoietic disorders, and the various dyslipidaemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein. Gaps ö 100.0%; Score 50; DB 8; Length 252; 100.0%; Pred. No. 2.4; 0; Indels 0; Mismatches Ouery Match Best Local Similarity 100. 206 GPLVCRGTL 214 1 GPLVCRGTL 9 Sequence 252 AA; ઠ 셤

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fissue kallikrein (EC 3.4.21.35) S1, submaxillary - rat (fragment)
NyAlternate names: glandular kallikrein; kininogenin
C;Species: Rattus norvegicus (Norway rat)
C;Date: 22-Unl-1987 #sequence_revision 22-Jul-1987 #text_change 09-Jul-2004
C;Accession: B23863
R;Ashley, P.L.; MacDonald, R.J.
Biochemistry 24, 4512-4520, 1985
A;Title: Kallikrein-related mRNAs of the rat submaxillary gland: nucleotide sequences A;Reference number: A23863; MUID:86051477; PMID:2998455
                                                                                                                                                A;Introns: 45/3
C;Superfamily: trypsin; trypsin homology
C;Keywords: glycoprotein; hydrolase; saliva; serine proteinase; submandibular gland
F;1-88/Domain: trypsin homology (fragment) <TRY>

Biochem. Biophys. Res. Commun. 211:586-589(1995).
-!- FUNCTION: May catalyze the degradation of intercellular cohesive
structures in the cornified layer of the skin in the continuous
shedding of cells from the skin surface. Specific for amino acid
residues with aromatic side chains in the PI position. SCGE
cleaves insulin B Chain is at the PI position. SCGE
cleaves insulin B Chain is in the PI position. SCGE
activation of precursors to inflammatory cytokines.
-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is
expressed by keratinocytes in the epidermis. Very low levels are
also seen in the brain and kidney.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hansson L., Backman A., Ny A., Edlund M., Edholm E., Tornell J., Wallbrandt P., Egelrud T.;

| AMENGES AND STATES AND | A 6 ;                              | 01-NOV-2001 (first entry)  Human stratum corneum chymotrypsin enzyme peptide #56 (residues 1-9).  Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia. | 1.<br>2001WO-US003977.                                                   | 2000US-00502600.<br>ARKANSAS.<br>676/56. | cancer comprises detecting stratum corneum chymotrypsin<br>Page 114; 127pp; English. | The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide |                |

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCN) primeras, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of (II) as useful in gene therapy techniques to restore normal ectivity of (II) are to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO at (ftp. wipo.int/pub/published_pct_sequences)
 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
 Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

 The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual. A peptide of the invention acts as a stratum corneum chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligonucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or peptides are also useful in the monitoring and development of immunotherapies for ovarian and other malignancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum
 Use of stratum corneum chymotrytic enzyme (SCCE) peptides, for vaccinating an individual against SCCE, and in monitoring and developing immunotherapies for ovarian and other malignancies.

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. B. coli) or eukaryotic and testing of cpds. useful for develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease
related vectors, transformed cells and polypeptides, useful for treating skin disorders, e.g. acne or psoriasis, and for identification of specific inhibitors.
 The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratotic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid p5507. The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises to prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves contermining the expression levels in a sample comprising prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contexting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and eternining whether the test agent modulaces the biological activity. (I) is useful as molecular markers, as afture targets, and for detecting, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate earcer. (I) and its expression conditions especially relating to prostate earce. (I) and its expression conditions especially relating to present earce. (I) and its safety etc. (I) is useful for assessing cancer eg., to determine the type of cancer.  The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells, which involves contexting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for
 Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.
discovery. (I) can also be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide. (I) is useful in therapeutic applications to tract prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein diferentially

the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, diagnosing, staging, grading, assessing, monitoring, prognosticating, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus cor specific genes, and groups of genes, expressed in pathways as specific genes, and groups of genes, expressed in pathways of functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein differentially

 The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a biological sample from the patient with a polymucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 mucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid melecule, polypoptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, determining tumour prognosis, early detection of pre-cancerous lesions, and as vaccines. This sequence corresponds to one of the proteins used
 Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic.
 Leber's hereditary optic neuropathy; LHON; mitochondrial encephalopathy lactic acidosis and stroke; MELAS; myoclonic epilepsy ragged red fibre syndrome; MERRF; cancer; neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic; osteopathic; ophthalmological; cytostatic.
 Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.
 Human heat mitochondrial protein as a therapeutic target SeqID639.
 anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart

 chymotryptic enzyme.";
Biochem. Biophys. Res. Commun. 211:586-589(1995).

-!- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the PI position. SCCE cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

The invention relates to a novel method for vaccinating an individual against stratum corneum chymotrytic enzyme (SCCE), comprising inoculating an individual with a SCCE peptide, which elicits an immune response in the individual with a SCCE peptide, which elicits an immune response in chymotrytic enzyme inhibitor. The SCCE peptide is useful for vaccinating an individual against SCCE, particularly an individual having, suspected or at risk of getting ovarian, lung, prostate, pancreatic or colon cancer. The oligomucleotide is useful for treating a neoplastic state in an individual, such as ovarian, breast, lung, colon, prostate, or pancreatic cancer, and other cancers in which SCCE is overexpressed. The peptides are also useful in the monitoring and development of immunotherapies for ovarian and other mallgnancies. The present sequence represents a peptide fragment of serine protease SCCE (stratum corneum

obesity, New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics

Claim 1; Page 171; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide

coestribed above and a carrier; (2) a kit comprising, in one or more

containers, the composition described above; (3) an isolated nucleic acid

molecule which encodes a NOVX protein of the invention; (4) a vector

comprising the nucleic acid molecule described above; (5) a cell

comprising the above vector; (6) an antibody that immunospecifically

binds to the polypeptide described above; (7) methods for determining the

comprising the above polypeptide or nucleic acid molecule in a

sample; (8) methods for determining the presence of or predisposition to

a disease associated with altered levels of expression of the above

co polypeptide or nucleic acid molecule in a first mammalian subject; (9) a

method of identifying an agent that binds to the polypeptide described

above; (10) a method for identifying a potential therapeutic agent for

cuse in treating a pathology that is related to an aberrant expression or

above; (10) a method for identifying a potential therapeutic agent for

cuse in treating a pathology that is related to an aberrant expression or

above; (10) a method got identifying a potential therapeutic agent for

co a pathology associated with the polypeptide; (12) a method for modulating

co perventing a pathology associated with the above polypeptide. NoVX

sequences have antidiabetic, anorectic, antibacterial, virucide,

con preventing a pathology associated with the above polypeptide in a

configuration and antilipamenic activities, and can be used in gene therapy. The

colypeptide is useful in manufacturing a medicament for treating a

WPI; 2004-213931/20. N-PSDB; ADN62903. Isolated NOVX polypeptides and nucleic acids, useful for preventing, diagnosing and treating e.g. cancer, diabetes and Alzheimer's disease.

Claim 1; SEQ ID NO 100; 395pp; English.

The invention relates to isolated NOVX polypeptides and polynucleotides.

NOVX polypeptides and polynucleotides are used to prevent, diagnose or treat a medical condition in human related to the aberrant expression and activity of NOVX polypeptides. For example, NOVX polypeptides and colynucleotides may be used to treat disorders associated with decreased polynucleotides may be used to treat disorders associated with decreased conduction or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NOVX polypeptides by binding with the cells own genes and preventing their expression. NOVX polymelectides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be in need of similar sequences in samples, and so which patients may be not need of similar sequences in samples, and so which patients may be used as anti-NOVX polypeptides and in assays to identify of NOVX. The production of antibodies and in assays to identify of NOVX.

Colypeptides. The anti-NOVX polypeptide antibodies may also be used as anti-NOVX polypeptide antibodies, agonists and antagonists and polymucleotide expression and activity of NOVX colypeptides and polymucleotides may be used in this way to prevent, diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, alreaments, cancer, cancer associated cachexia, mencadegemerative disorders, harmadegemerative charmatopoietic disorders, and the various dysl

```
The invention relates to extracellular serine protease termed tumour antigen derived gene-14 (TADG-14) and its nucleic acid. Composition comprising TADG-14 peptide is useful for treating a neoplastic state in individual. The neoplastic state is chosen from ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer in which TADG-14 is overexpressed. The present sequence is Stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the exemplification of the invention.
 Novel isolated DNA encoding tumor antigen derived gene-14 protein, useful
 for treating neoplastic state (such as ovarian cancer, breast cancer, lung cancer, colon cancer, prostate cancer) in an individual.

 The present invention relates to novel activated immune T cells or dendritic cells directed toward extracellular serine protease termed tumour antigen derived gene-14 (TADG-14). The method of the invention involves exposing the immune cells to a TADG-14 protein fragment, where exposure to the TADG-14 protein fragment activates the immune cells. The invention is used for the production of activated immune T cells or dendritic cells. The invention allows screening to identify proteases overexpressed in carcinoma. The present sequence is stratum corneum chymotryptic enzyme (scce) catalytic domain. This sequence is used in the
 Production of activated immune cells or dendritic cells by exposing immune cells to tumor antigen derived gene protein fragment consisting of
wasting disorders associated with chronic diseases and various cancers. They may also be used as antibacterial agents. The present sequence represents the amino acid sequence of a human NOVX protein.

 The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
polypeptide or nucleic acid molecule in a first mammalian ubject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therappeutic agent for
compression of the above polypeptide or nucleic agent for
aberrant physiological interactions of the polypeptide; (11) a method of
above; (10) a method for identifying a potential therappeutic agent for
compression or aberrant bypasological interactions of the polypeptide; (11) a method of
above; (10) a method for identifying a potential presence or pathology associated with the polypeptide; (12) a method of
corporating of the polypeptide described above; (13) methods of treating
cor preventing a pathology associated with the above polypeptide. NOVX
sequences have antidiabetic, anorectic, antibacterial, virucide,
corporated and and an appropriate or the nucleic
and antilipaemic activities, and can be used in gene therapy. The
colypeptide is useful in manufacturing a medicament for treating a

The invention relates to isolated NoVX polypeptides and polymucleotides. NoVX polypeptides and polymucleotides are used to prevent, diagnose or novX polypeptides and polymucleotides are used to prevent, diagnose or creat a medical condition in human related to the aberrant expression and activity of NoVX polypeptides. For example, NoVX polypeptides and controlled to the administered to down regulate expression of NoVX polypeptides by production or to rectify mutations. Conversely, antisense NA molecules may be administered to down regulate expression of NoVX polypeptides by binding with the cells own genes and preventing their expression. NoVX polypeptides and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar sequences in samples, and so which patients may be in need of crestorative therapy. NoVX polypeptides may also be used as intigens in the production of antibodies and in assays to identify modulators (agonists and antagonists) of the expression and activity of NoVX. The cust of modulate NoVX polypeptide antibodies, agonists and antagonists and antagonists and the expression and activity of NoVX polypeptides. The anti-NoVX polypeptide antibodies, agonists may also be used as diagnose and treat: metabolic disorders, diabetes, obesity, infectious disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, ciscurer, cancer_associated cachexia, neurodegemerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, cancer_associated with obesity, the metabolic cachexia, and the various dyslipidaemias, metabolic wasting disorders associated with obesity, the metabolic cachesian and various cancers. They may also be used as antibacterial agents. The present sequence of a human NoVX protein.

```
The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98600). TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
 Novel extracellular serine protease, termed tumor antigen-derived gene : protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.

 MEDLINE=94308225; PubMed=8034709;
Hansson L., Stroemqvist M., Baeckman A., Wallbrandt P., Carlstein A.,
 Blochcem. Blophys. Res. Commun. 211:586-589(1995).

-!- FUNCTION: May catalyze the degradation of intercellular cohesive structures in the cornified layer of the skin in the continuous structures in the cornified layer of the skin in the continuous shedding of cells from the skin surface. Specific for amino acid residues with aromatic side chains in the Pl position. SCCE claves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines.

-!- TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

-!- SIMILARITY: Belongs to the peptidase SI family. Kallikrein
 Hansson L., Backman A., Ny A., Edlund M., Edholm E., Tornell J., Wallbrandt P., Egelrud T., "Epidermal overexpression of stratum corneum chymotryptic enzyme in mice; a model for chronic ithchy dermatitis "; Submitted (DEC-2000) to the EMBL/GenBank/DDBJ databases.

Patent No. 6291663
GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
TITLE OF INVENTION: TANG-12: A No. 6291663el Transmembrane Serine Protease
TITLE OF INVENTION: Overexpressed in Ovarian Carcinoma
FILE REPRENCE: D6192
CURRENT APPLICATION NUMBER: US/09/261,416A
CURRENT PILING DATE: 1999-03-03
SEQ ID NO?
 NAME/KEY: DOMAIN
CTHER INFORMATION: Amino acid sequence of stratum corneum chymotryptic
CTHER INFORMATION: enzyme (scce) catalytic domain
US-09-618-259-4
 FEATURE: OTHER INFORMATION: Serine protease catalytic domain of stratum corneum OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar OTHER INFORMATION: domain in TADG-12
